

Vizion Bun Quality/Swirls

7-26-2018

To Whom It May Concern:

There have been questions raised regarding the Vizion bun Quality when a “swirl” type pattern is sometimes visible in the skived product. While this swirl phenomenon is sometimes visible in our bun products it does not affect the physical properties or performance of the product.

- In most cases these swirls cannot be felt to the touch... but are visible
- This mild form of swirl is an aesthetic result that happens naturally in the bun manufacturing process

Please Note:

A major swirl in the bun that can be felt and may result in a performance change, this swirl may or may not affect the end product. This type of swirl is a manufacturing defect and can be submitted for a material credit.

- In most cases a swirl limit can be established with a cooperative discussion including samples of the limitations that can be followed on a case by case situation.
